A method has been developed for the amplification of a DNA fragment in which amplification is carried out on the DNA fragments of a number of different DNAs. The method comprises a PCR reaction repeatedly carrying out a heat-denaturing step, a primer annealing step and a polymerase extending step, to amplify the DNA fragments of a plural of different DNAs. The method can detect the existence of a microbe in organic waste. AAZ41424 to AAZ41639 represent PCR primers used in random amplified polymorphic DNA arbitrarily primed PCR, for the detection of microbes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying, comparing and detecting inhibitors of protein-protein interactions within population of host cells, involves detecting regulation of transcription of nucleic acid sequence by fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The present invention describes a method for detecting (D) at least 1 protein-protein interaction (PII) by recombinantly expressing within a protein-protein interaction (PII) by recombinantly expressing within a comprising DNA binding domain (DBD) and transcriptional regulatory domain (TRD) respectively and detecting the regulation of transcription of mucleotide sequence of host calls operably linked to a promoter driven by DBD. The detection method (D) is useful for identifying inhibitors of PPI for therapeutic use, and for detecting specific cell types, tissue types, stage of development and disease states. From the population of the proteins characteristic of the particular tissue or a cell-type, all possible detectable PPI that occur can be identified and genes encoding these proteins can be isolated. Thus, parallel analysis of two cell types out. This analysis has significant value since PPI specific to a disease that can serve as therapeutic points of intervention. Inhibitors of PPI can also be isolated in rapid fashion. The number of false positives and low throughput are reduced, AAA55863 and AAA55961 are sequences used in the exemplification of the present invention
can also be isolated in rapid fashion. The number of false positives and low throughput are reduced. AAA55843 to AAA55963 and AAY90961 are sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying, comparing and detecting inhibitors of protein-protein interactions within population of host cells, involves detecting regulation of transcription of nucleic acid sequence by fusion protein interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Yeast, detection, protein-protein interaction, DNA-binding domain, characterisation; identification, protein pathway information, protein interaction domain; screening; PCR primer; adapter; linker; fusion protein; inhibitor; regulation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid encoding mammalian Lhx3 for identifying a human with a disease, disorder, or condition caused by an altered level of expression or binding of Lhx3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated nucleic acid (I) encoding a mammalian Lhx3. (I) is used in assays to: (1) detect and quantify the presence and level of expression of Lhx3. Lhx3a or Lhx3b, in a sample; (2) identify a compound that affects expression, the level of expression, or the activity of Lhx3, Lhx3a, or Lhx3b in a cell; (3) identify a compound that affects expression, the level of expression, of a pituitary trophic hormone gene promoter; (4) identify a human afflicted with a disease, disorder, or condition caused by altered expression of Lhx3 or altered level of binding of Lhx3 to a nucleic acid; and (5) detect a mutation in a Lhx3 allele in a human. The coding region of human Lhx3 has been genomically mapped to the subtelomeric region of chromosome 9. Lhx3 is also known as P-LIM or LIM-3. The present sequence represents a human Lhx3 expression boundary oligonucleotide, which is

                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to methods for detecting and isolating genes encoding proteins that interact with each other, via the reconstitution of a transcription factor and hence reporter gene activation. Proteins are fused to either the yeast DNA-binding domain of a transcriptional activator or to the activation domain of a transcriptional activator. The present sequence is a linker used in the present invention as an adapter in the analysis of yeast fusion genes. The present method may be used to identify protein-protein interactions and genes encoding the interacting proteins relevant to a particular tissue, stage or disease e.g. cancer
                                                                                                                                                                                                                                                                          Detecting protein-protein interactions in protein populations useful identifying genes encoding the proteins, and inhibitors of the interactions, by detecting transcriptional regulation leading to repos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting protein-protein interactions in protein populations useful for identifying genes encoding the proteins, and inhibitors of the interactions, by detecting transcriptional regulation leading to reporter gene activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to methods for detecting and isolating genes encoding proteins that interact with each other, via the acconstitution of a transcription factor and hence reporter gene activation. Proteins are fused to either the yeast DNA-binding domain of a transcriptional activator or to the activation domain of a transcriptional activator. The present sequence is a linker used in the present invention as an adapter in the analysis of yeast fusion genes. The present method may be used to identify protein-protein interactions and genes encoding the interacting proteins relevant to a particular tissue, stage or disease e.g. cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Linker; yeast; two-hybrid system; protein-protein interaction; cancer;

This invention relates to a method for amplifying a DNA fragment. The method comprises successive repetitions of heat-denaturing, annealing of a primer and an extending step using a DNA polymerase. The method makes use of a cDNA pool in which the primer is one primer or a pair of primer sets and has an amplification probability which allows it to amplify a DNA fragment from a limited number of the cDNAs among the DNA pool (where the limited number is in the range of 1 to 25). Also included in the invention are apparatus used for carrying out the method, a primer and a bux polymerase and a kit used for amplifying a DNA fragment. The method can be used to amplify a limited number of CDNAs from a pool in which wide variety of cDNAs are present. Oligonucleotides AAC97775 - AAC97990
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to nucleic acids containing a modified base, especially a substituted vinyl group at the 5-position of a pyrimidine, such that nucleic acids can be reversibly ligated to each other by light-irradiation. The nucleic acids with unique structures can be synthesised for use in gene therapy, DNA computing and immobilisation of nucleic acids. The ligation and immobilisation processes involve the use of light, which is environmentally friendly. The present sequence is that of an oligonucleotide useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Modified base, vinyl group, reversible ligation; irradiation, gene therapy, DNA computing; immobilisation; 88.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to nucleic acids containing a modified base, especially a substituted vinyl group at the 5-position of a pyrimidine, such that nucleic acids can be reversibly ligated to each other by light-irradiation. The nucleic acids with unique structures can be synthesised for use in gene therapy, DNA computing and immobilisation of nucleic acids . The ligation and immobilisation processes involve the use of light, which is environmentally friendly. The present sequence is that of an oligonucleotide useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

microarray

```
The present sequence is a probe used to demonstrate array-based nucleic acid hybridisation. This was an example in a specification relating to a method for producing an array of discrete bloaties comprising non-covalently attached nucleic acids. The nucleic acids are useful as probes in hybridisation reactions. The affinity and selectivity of the non-covalently immobilised probe to sample target duplex formation is excellent and compact compared to conventional methods and unlabelled probes are applied at a concentration which is at least five times lower than required for conventional methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Association device for nucleic acid-based diagnostic test, isolation of nucleic acids, comprises oligonucleotide probe and solid substrate having support surface comprising association surface for linking probe to substrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an association/hybridisation device comprising nucleic acid and polypeptide probes, or combinations of these, linked to a porous solid substrate, comprising an external substrate surface and several internal pores. The pore surfaces comprise an association surface which is charged with net positive or negative charge density where the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hybridisation device, single base pair difference, diagnostic test, protein purification, nucleic acid purification, secondary structure, probe, 88; k-ras; codon 12.
                                                         Producing nucleic acid array for use in hybridization reactions, by employing adsorptive, non-covalent attachment of nucleic acids and oligonuclectide probes to positively charged solid surfaces.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a probe used to demonstrate array-based nucleic acid hybridisation. This was an example in a specification relating to a method for producing an array of discrete biosites comprising non-covalently attached nucleic acids. The nucleic acids are useful as probes in hybridisation reactions. The affinity and selectivity of the non-covalently immobilised probe to sample target duplex formation is excellent and compact compared to conventional methods and unlabelled probes are applied at a concentration which is at least five times lower
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                        Producing nucleic acid array for use in hybridization reactions, by employing adsorptive, non-covalent attachment of nucleic acids and oligonuclectide probes to positively charged solid surfaces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

uncleic acid or a polypeptide probe. The device is also useful for associating a mucleic acid or a polypeptide in a sample to a nucleic acid or a polypeptide probe. The device is also useful for a cutecting a single base pair difference between a mucleic acid in a test sample and an oligomuclectide probe. The device finds application in nucleic acids based diagnostic tests, isolation and purification of nucleic acids or polypeptides from a sample. The device can be used at any temperature and the kinetics of association between the oligomuclectide probe and the nucleic acid in the test sample are 10 fold more rapid than the kinetics of association under conditions when the substrate surface or association surface has a neutral or net negative charge density. The device and the method can be used for hybridisation or present sequence is that of a k-ras capture probe. As a representative probes to target DNA or RNA at low bulk ion concentrations. The present sequence is that of a k-ras capture probe. As a representative was used to examine hybridisation rate enhancement under low ionic strength and low ph conditions. The capture probes (AAISS966-AAISS972) comprise biologically significant codon 12 point mutations
   pH is lower or higher than the pI of association surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 12 BP; 1 A; 2 C; 6 G; 3 T; 0 U; 0 Other;

Association device for nucleic acid-based diagnostic test, isolation of nucleic acids, comprises oligonucleotide probe and solid substrate having support surface comprising association surface for linking probe to

Example 13; Page 63; 101pp; English.

The invention relates to an association/hybridisation device comprising nucleic acid and polypeptide probes, or combinations of these, linked to a porous solid substrate, comprising an external substrate surface and several internal pores. The pore surfaces comprise an association surface which is charged with net positive or negative charge density where the

the second that the professoriation surface. The device is useful for associating a nucleic acid or a polypeptide in a sample to a nucleic acid or a polypeptide probe. The device is also useful for detecting a single base pair difference between a nucleic acid in a test sample and an oligonucleotide probe. The device finds application in cucleic acid-based diagnostic tests, isolation and purification of mucleic acid-based diagnostic tests, isolation and purification of any temperature and the kinetics of association between the colliqued probe and the nucleic acid in the test sample are 10 fold concertage than the kinetics of association under conditions when the substrate surface and the mucleic acid in the test sample are 10 fold concertage surface or association surface has a neutral or net negative charge density. The device and the method can be used for hybridisation of probes to target DNA or RNA at low bulk ion concentrations. The present sequence is that of a k-ras capture probe. As a representative present sequence is that of a k-ras capture probe. As a representative consented to examine hybridisation rate enhancement under low ionic strength and low pH conditions. The capture probes (AAI66966-AAI66972) comprise biologically significant codon 12 point mutations

(EPIG-) EPIGENOMICS AG

Olek A, Piepenbrock C,

WPI; 2001-657177/75.

Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.

Claim 1, SEQ ID NO 283485, 29pp + Sequence Listing, German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligomers for detecting single nuclectide polymorphisms (SMP) and cytosine methylation status in chemically pretreated genomic DMA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABCO0010

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 tepsesent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but thouson the bublished_pct_sequences
-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at flow bublished_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide primer SEQ ID NO 291409 for detecting SNP TSC0014784.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gestrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC90989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC001013 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire, wipo.int/pub/published_pot_sequences
              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligonucleotide primer SEQ ID NO 286512 for detecting SNP TSC0012735.
                                                                                                                                                                                                                                                                                                                                                           Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 285727; 29pp + Sequence Listing; German.

                                                                                                                                                                                                                 This invention describes novel oligonucleotide primer: or peptide nucleic acid (PNA) oligomers for detecting single nucleotide; Jymorphisms (SNP) and cytosine methylation status in chemically pretreat depond DNA. The oligonucleotides are used for diagnosis and/or prognot. S of cancer and a range of diseases including immune system, gastrointes inal, respiratory, central nervous system, axidovascular and metabolic csorders. The oligomers are also used for detecting cell type differ intiation. ABC00010-ABC99989, ABF00010-ABF9989, ABF00010-ABF9989 and AI 00010-ABF82073 represent the oligomers described in the invention. N. E: The sequence data for this patent did not form part of the printed pecification, but the was obtained in electronic format from WIPO at

               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF82073 targresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, azdiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99899, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotide primer SEQ ID NO 293994 for detecting SNP TSC0015906.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel oligonucleotide prime: or peptide nucleic acid (PNA) oligomers for detecting single nucleotide olymorphisms (SNP) and cytosine methylation status in chemically pretreaded genomic DNA. The oligonucleotides are used for diagnosis and/or progreaded of cancer and a range of diseases including immune system, gastrointe tinal, respiratory, central nervous system, cardiovascular and metabolic isorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH9989 and / 100010-ABI82073 represent the oligomers described in the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovas ular; primer; ss; central nervous system; gastrointestinal; respiratory immune; metabolic.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nuclectide; jlymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic diseonders. The oligoners are also used for detecting cell type differentiation. ABC0010-ABE99989, ABF00010-ABE99989, ABH0010-ABE99989 and AH:00010-ABE82073 data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascalar; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotide primer SEQ ID NO 286574 for detecting SNP TSC0012735.
                                                                                                                                                                                                                                                                                                                                                 Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; SEQ ID NO 274980; 29pp + Sequence Listing; German.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, artdiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

Recombinant adeno-associated virus containing growth cormone gene or related genes, useful for accelerating swine growth and increasing lean meat ratio.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a recombinant adeno-associated virus (AAV) which expresses a DNA comprising a growth hormone gene. This can used to express growth hormone in a infected swine, which leads to increased growth and food conversion and improved mea: quality. The present sequence is an inverted terminal repeat descr bed in the exemplification of the invention
substrates, inhibitors or modulators of the hPXR gene product. The proteins can be used to identify and obtain prodrugs and drugs for treatment of diseases which are amenable to chemother py. The nucleic acids can be used in gene therapy for the treatment of prevention of disorders associated with hPXR expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAV; adeno-associated virus; growth hormone gene; growth, GH; vector; inverted terminal repeat; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAV containing growth hormone gene related inverted terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 7.8; DB 1; Length 12;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF9989, ABF00010-ABF9989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

```
Detection of protein to protein interactions amongst two protein populations useful e.g. to identify interactions specific for particular tissues or diseases and to identify inhibitors of interactions uses a new genetic method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example; Col 197; 152pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences ABB90526-ABB90715 represent novel proteins from Chlamydia pneumoniae (strain CWL029), and ABL91184-ABL91373 represent DNA encoding them. The proteins are preddicted to be immunogenic and may therefore be useful in vaccine production and for diagnostic purposes. Chlamydia pneumoniae is a common cause of respiratory disease in humans, and is also involved in the development of cardiovascular diseases such as theresclerosis, coronary artery disease, carotic artery stenosis, coronary artery disease, acrtic aneurysm, claudication and stroke. The proteins and nucleic acids of the invention may be used in vaccines and pharmaceutical compositions for the proteins and nucleic acids of the invention prevention or treatment of chlamydial infections, particularly Chlamydia prevention or treatment of chlamydial infections particularly chlamydia by proteins and the nucleic acids may be used in PCR, branched DNA probe assay or blotting techniques for determining Chlamydia DNA probe assay or blotting techniques for determining Chlamydia preventions in the amplification of the novel Chlamydia pneumoniae commander amplification of the novel Chlamydia pneumoniae commander amplification of the novel Chlamydia pneumoniae commander amplification of the novel Chlamydia preumoniae commander amplification of the novel Chlamydia pneumoniae commander amplification of commander amplification of commander amplification of commander amplification of commander am
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel Chlamydia pneumoniae protein useful in the manufacture of a medicament for treatment or prevention of infection due to Chlamydia, preferably Chlamydia pneumoniae, and for diagnostic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present invention relates to novel methods for detecting protein to protein interactions amongst two populations of proteins, each having a complexity of at least 100. The method involves using new genetic methods in which encoded proteins are fused to either the DNA-binding domain of a transcriptional activator or the activation domain of a transcriptional activator or the activation domain of a transcriptional activator. The methods are useful to detect interacting proteins and to identify protein-protein interactions specific for a particular species, tissue, stage of development or disease state, e.g. by comparing protein protein interactions between populations from cDNA of cancerous or precancerous cells with those from non-cancerous cells. They are also useful to identify inhibitors interfering with protein-protein interactions e.g. potential drug candidates inhibiting interactions specific to cancerous cells. The present sequence is a linker DNA used to illustrate the method
                                                                                                                                                                                                                                                                                                                                                       Detection of protein to protein interactions amongst two protein populations useful e.g. to identify interactions specific for particular tissues or diseases and to identify inhibitors of interactions uses a new genetic method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Phosphoramidite, INVADER assay cleavage reaction, FEN1, cleavase, nucleic acid separation; DNA polymerase, human, MCP-1, ubiquitin, monocyte chemoattractant protein-1; PCR; primer; probe, ss.
                                                                                                                                                                                                                                                                                          Yang M, Knight JR, Kalbfleisch TS;

The composition is useful for separation of mucleic acid molecules. The composition is further useful for fractionation of specific nucleic acids by select we charge reversal useful in e.g. INVADER assay cleavage reactions, and in the synthesis of charge-balanced molecules. In the fractionation of muleic acid of products from substrates (i.e. provides a 100% separa ion). Through the products from substrates (i.e. provides a 100% separa ion). Through the constructed with sufficient modification due to the fact that the normally negatively charged strand is made nearly neutral It is also possible to distinguish between a enzymatically or thermally degraded DNA fragments due to the absence or presence of 3 phosphare. ABS68740-ABS68813 represent coding sequences and primers used ... the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, breast cancer, breast cancer associated protein isoform; BPI;

The present invention describes a method for the screening, diagnosis or prognosis of breast cancer (BC), determining the stage or severity of BC, and monitoring the effect of therapy administered to a subject having BC, comprising analysing a sample of body fluid by two dimensional comprising analysing a sample of body fluid by two dimensional comprising a chosen feature whose abundance correlates with BC or predicts the onset or course of BC. The method (I) involves: (a) analysing a sample of body fluid from the subject by two-dimensional comprising a chosen feature whose relative abundance correlates with BC or predicts the onset of BC, and (b) comparing the abundance of each corporate in the sample with the abundance of that chosen feature in the sample with the abundance of that chosen feature in the sample with the abundance of that chosen feature in the sample with the abundance of that chosen feature in the sample with the abundance of that chosen feature in the sample of the stage or severity of BC, or with the abundance of an expression reference feature (BRF) in the cest sample. The method is useful for screening, diagnosis or prognosis of breast cancer, determining the stage or severity of BC, monitoring the effect of therapy administered to a subject having BC, and corporate and particular isoform (BPI) peptide ceptures of the present invention isoform (BPI) peptide cepture or exemplification of the present invention Screening, diagnosis or prognosis of breast cancer, by analyzing a sample of serum or plasma by two dimensional electrophoresis to detect the presence or level of a breast cancer-associated feature. New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.

Example 1; Page 59; 81pp; English.

the present invention centrices a zinc finger procesh. 1) that binds to a target site, comprising a first (81), a second (72), end a third (73) comprising a first (81), a second (72), and a third (73) comprises, in 3'-5' direction, a first (81), a second (82), and a third (83) target subsite. Also described are: (1) a polypeptide (11) comprising (1); (2) a polymucleotide (111) encoding (1) or (11); and (2) indescribed are: (1) a polypeptide (2) designing (M) (1) involves selecting the PI zinc finger such that it binds to the SI target subsite, and selecting the PI zinc finger such that it binds to the SI target subsite, and selecting the PI zinc finger such that it binds to the SI target subsite, thus designing (1) that binds to a target site (1) is useful for recognition of the subsite. (1) is useful in studying gene function, and for human therapeutic methods to modulate the expression of a target region within a subject, in considering the expression of a target region within a subject, in the sample, and in assays to determined the phenotype and function of gene expression. (1) has improved affinity and specificity for their target sequences as well as enhanced biological activity. useful in studying engineering, comprises N- to C-terminus. New zinc finger protein that binds to target site, gene function and for human therapeutics and plant first, second and third zinc fingers, ordered from

Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.

The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity

Disclosure, Page 24; 34pp; English

Example 1; Page 59; 81pp; English.

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) zinc finger, ordered FI, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide

```
(II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and binds to the S1 target subsite, selecting the F1 zinc finger such that it binds to the S2 target subsite, selecting the F2 zinc finger such that it binds to the S2 target subsite, may designing (I) that binds to the S3 target subsite, thus designing (I) that binds to that the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for "most position of the subsites having the nucleotide G in the 5' most position of the subsites and plant useful in studying gene function, and for human therapeutics and plant engineering. (I), (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within a subject, in a sample, and in assays to determined the phenotype and function of gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced biological actifity. ABO71213 to ABO71214 and ABP48191 to ABP51230 represent DNA target: sequences and tinc finger peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                         ö

The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.
                                                                                                           Gaps
                                                                                                           ;

Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of designing a zinc inger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affining and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA carget sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .

Attenuation of pathogenic HIV-1 strain NL4-3 involves deletion of 1 or more decanucleotides (AAQ96406-Q97018) from the nef g ne and/or 1 or more decanucleotides (AAQ97019-Q97166) from the LTR region. The sequence of AAQ95406 corresponds to nucleotides 1-10 of the nef gene (AAQ96141). The response in humans, and enable the generation of therapeutic, and immune and targeting agents against HIV-1 infection. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                        Attenuation of pathogenic HIV-1 strain NL4-3 involves deletion of 1 or more decanuclectides (AAQ96406-097018) from the nef gune and/or 1 or more decanuclectides (AAQ96109-097166) from the LTR region. The sequence of AAQ96406 corresponds to nucleotides 1-10 of the nef gune (AAQ96141). The response in humans, and enable the generation of their peutic, diagnostic and targeting agents against HIV-1 infection. (Update: peutic, diagnostic standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New non-pathogenic HIV-1 strain carrying a deletion in its nef gene LTR region - can be used in a vaccine to inhibit/redure productive infection in an individual by a pathogenic strain.
            New non-pathogenic HIV-1 strain carrying a deletion is its LTR region - can be used in a vaccine to inhibit/reduse proinfection in an individual by a pathogenic strain.

```
AAT28375-T28379 represent oligomuclectides used in the method of the invention. This sequence represents a DAR-PEG-malemide sequence, which was ligated to a random pool sequence (see AAT28376) using a DNA bridge oligomuclectide (see AAT28377) to obtain a nucleic acil-reactant test mixture. The conjugate is then reacted with a second reactant test biotinylated diene prepared from NHS-blotin and 2,4-he cadien-1-ol). The products were loaded on an immobilised strength olim and the bound RNA was released by treatment with proteinase K. The fluted RNA was then reverse transcribed as in typical systemic evolution of ligands by exponential enrichment (SELEX) reactions. This process is repeated to obtain the desired product. This method can be used to identify products that bind to, or perform a preselected function on, a target sequence. The products and the methods can be used to produce therapeutic, diagnostic, prophylactic, commetic or agricultural compositions. This parallel SELEX reaction comprises forming a product library by contacting two or more reactants. The method does not require kee:ing track of a matrix of products, and does not require highly efficient or rapid matrix of products formation is directed by nucleic ac ds which when reactions. Product can be easily amplified and the product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ; 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           stallel SELEX method - uses nucleic acid-reactant mixture e.g. therapeutic, diagnostic and agricultural compsns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The product can have the ability to perform a preselected function on a target. The process can be used to produce having various therapeutic, prophylactic, used to produce such as pyridines. The process produces along such as pyridines. The process produces a large, structurally diverse library of products
                                                                                                                                                                                                                                                                                                       Production of a product having the ability to perform a preselected function on a target - comprises preparing a nucleic .cid test mixture, coupling with a first reactant, forming a product lib:ary, contacting with target, and partitioning the product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human immunodeficiency virus; HIV; trans-acting responsive element; gene expression; viral; retroviral; infection; AIDS; mimetic; TAR; acquired immunodeficiency syndrome; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotides for modulating gene expression b_{\mathcal{Y}} RNA mimicry useful for treating viral and retroviral diseases such as AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is shown in the disclosure of the present invention. The present invention describes methods for interfering with HIV replication in vitro comprising: (1) contacting the vitus with an objgonucleotide (0N) or its analogue comprising the sequence (1); (2) and (3) contacting the virus with ON or its analogue comprising the sequence and a sequence selected from the group consisting of [III), [IV) and (V): 5'-CUGGGA-3' (I) 5'-CUGGGA-3' (I) 5'-NNUCNN-3' (III) 5'-NNUCNN-3' (IV) 5'-NNUCNN-3' (III) 5'-NNUCNN-3' (IV) 5'-NNUCNN-3' (IV) 8'-NNUCNN-3' (IV) 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibition of HIV replication in vitro – comprises contacting virus with RNA oligo:nucleotide or its analogue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         function; target; therapy; prophylactic; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaba

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                   The invention relates to defined oligonucleotides (or their analogues) that are able to mimic the secondary or tertiary structure of RNA molecules, especially mRNA. It provides specific oligonucleotides (AAXOS657-661) which mimic the human immunodeficiency virus (HIV) transacting responsive element (TAR). The RNA mimicry oligonucleotides mimic particular strands of RNA, especially mRNA, containing secondary structures important for RNA, protein interactions. The interaction of structures important for RNA, protein interactions of proteins with mimic molecules minimises the interactions of proteins with adjouncleotides are useful for regulating/ modifying gene expression and can be used in therapeutics for the treatment of viral and retroviral infections such as acquired immunodeficiency viral and research reagents, and kits. The present sequence represents a specifically claimed TAR mimetic oligo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; monocyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; cTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.

expression) tags used to identify many transcripts encoding immunostimulatory cofactor proteins which are preferentially or immunostimulatory cofactor proteins which are preferentially or immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes, particularly against tumour antigen presentation by T-cell receptors is alone activation of cytotoxic immune response that can lyse insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGI tags have several potential uses.

They may be used in vaccines to induce an immune response that can lyse consequences identified using the SAGI tags have several potential used in vaccines to induce an immune response of an APC; and as hybridisation probes/amplification privars for the capression of these genes. Detection of diseases relate to abnormal expression of these genes. Detection of the enduritic cell differentially expressed genes, or of thair encoded proteins, can be used in active immunotherapy (or to stimulate production of an end in active immunotherapy (or to stimulate production of an end in active immunotherapy (or to stimulate production of the enduringent and presentation of endogenous APCs and upregulates the AFCs for the presentation of cellinguals, migration to for estimulatory factors ensures adequate antigens and presentation of cellinguals, migrat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

Sequences AAZ77573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mENA transcripts encoding immunostimulatory ordactor profesins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells while preferentially or differentially expressed in dendritic cells while other transcripts correspond to novel genes. Antigen-presenting cell (APC) associated coostimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory offactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid
Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
                                                                                                                                                                                                                     Claim 1; Page 80; 130pp; English.

They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for against a tumour antigen; to modulate the genotype of an APC; to screen for against a tumour antigen; to modulate the genotype of an APC; to screen a APC; and as hybridisation probes/amplification primers for the chapmosis, prognosis and monitoring of diseases related to abnormal chapmosis, prognosis and monitoring of diseases related to abnormal compression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins; can be used to identify calls as belonging to the monocyte lineage. Cells containing these genes can be used in active immuncherapy (or to stimulate production of a population of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of them antigen and presentation of co-stimulatory factors ensures adequate antigen to presentation of co-stimulatory signals, migration of chemokines for secretion of real growth factors and secretion of chemokines for recruitment of immune effector cells
                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1-NDD-6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -NUL-6
     Sequences AAZ77573-279709 represent SAGE (serial analysis of gene expression) tags used to identify maNA transcripts encoding differentially expressed in monocyte-derived dendritic cells compared affectentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell other transcripts presentation by T-cell receptors is alone activation of the cytotoxic immune response, particularly against tumour cells. Immunostimulatory cofactors also being required for insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses.

They may be used in vaccines to induce an immune response, particularly against a tumour antiged, to modulate the genotype of an APC, to screen for against that modulate expression of the Genotype of an APC, and as hybridiation probes/amplification primers for the expression of the dendritic cell affermatially expressed genes, or of their encoded proteins, calls containing these genes. Detection of the dendritic cell affermation of expressed genes, or of their encoded proteins, calls containing them are used in active immunotherapy (or to stimulate production of a population of antigen-psecific effector cells and belonging to the monocyte lineage. Cells containing them are used in active immunotherapy (or to stimulate production of a population of antigen-psecific effector cells) and vectors containing them are used in active immunotherapy (or to stimulate the are used in general product factors e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
                                                                                                                                                                                                                                                                                           Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.

Sequences AAZ77573-Z79709 represent SAGE (serial analy is of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in moncyte-derived dendritic cells compared with moncoytes. Some of the transcripts correspond to inown genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell (APC)-associated coetimulatory factors play an important role in the activation of the cytctoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major listocompatibility complex) and subsequent recognition by T-cell receptor listocompatibility insufficient to activate a robust cytctoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
SAGE tag, serial analysis of gene expression, antigen-presenting cell, APC; moncoyte-derived dendritic cell, differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte, tumour antigen; immunotherapy; anticancer; ss.

efficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in an APC; and as hybridisation probes/amplification primers for the can appear, prognosis and monitoring of diseases related to abnormal expressed genes. Detection of the dendritic cell differentially cypressed genes. Detection of the dendritic cell differentially carbesed genes, or of thair encoded proteins, can be used to identify cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a popularison of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of immune effector cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; monocyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.

the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses.

They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for against a tumour antigen; to modulate the genotype of an APC; to screen can APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes in expression of their encoded proteins, can be used to identify calls as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen correspondences appeared to endogenous APCs and upregulates the APCs for the Epresentation of co-stimulatory signals, migration to T cell-rich sites, secretion of I cell growth factors and secretion of chemokines for recruitment of immune effector cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated polymucleotides differentially expressed betwhen metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, metastatic breast tumour tissue; breast cancer; tag; primer; non-metastatic breast tumour tissue; gene therapy; anticancer; antimetastatic; vaccine; diagnosis; ss.

Some of the transcripts correspond to known genes or EST9 (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to noved genes. Antigen-presenting cell (APC) -associated costimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.

```
ct hat are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ8677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcribts can be used for disquosis, prognosis, monitoring and transcripts can be used for disquosis, prognosis, monitoring and transcripts can be used to nybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for disquosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic against Host cells that produce the polypeptides or as therapeutic and isolate populations of educated, and these used for adoptive cells, e.g. cybotoxic T lymphocytes, and these used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           immunotherapy

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ8677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cities that are downregulated in metastatic breast tumour cells). These transcripts can be used for disquosis, prognosis, monitoring and transcripts can be used for disquosis, prognosis, monitoring and by standard immunoassays or hybridisation/amplification reactions. Or preferent of breast cancer, particularly where metastatic biagnosis is by standard immunoassays or hybridisation/amplification reactions. Or preferent of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression of the transcripts are potentially useful for treatment of conferences or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based conficiens. Polypeptides encoded by the transcripts are also useful in vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host produce the polypeptides or as therapeutic and isolate populations of educated, and isolate populations of educated, and these used for adoptive

that are preferentially transcribed in the metastatic oreast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ89342 to AAZ86677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for hybridisation/amplification reactions. Or standard immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of [metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense selected cell types, of particularly an antigen-encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, munch because of the readoutive used for adoptive cells, e.g. cytotoxic I lymphocytes, and these used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, metastatic breast tumour tissue; breast cancer; tag; primer; non-metastatic breast tumour tissue; gene therapy; anticancer; antimetastatic; vaccine; diagnosis; ss.

that are preferentially transcribed in the metastatic breast tumour that are preferentially transcribed in the metastatic breast tumour cells. AAZ83942 to AAZ86677 represent tags corresponding to distinct transcribts that are to AAZ86677 represent tags corresponding to distinct transcribts that are corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These care downedguated in metastatic breast tumour cells). These transcribts can be used for disgnosis, prognosis, monitoring and transcribts can be used for disgnosis, prognosis, monitoring and creatment of breast cancer, particularly where metastatic. Disgnosis is by standard immunoassans or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of ceg. therapeutic genes (also riboxymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic adents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter immunched the polypeptides used for adoptive immune the second calls that produce the polypeptides can be used to expand immune them.
Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

that are preferentially transcribed in the metastatic breast tumour cells.

that are preferentially transcribed in the metastatic breast tumour cells. Adz83942

tissue (i.e. are upregulated in metastatic breast tumour cells). Adz83942

to AAZ86677 represent tags corresponding to distinct transcripts that are

to preferentially transcribed in the primary or non-metastatic breast tumour

tissue (i.e. are downregulated in metastatic breast tumour cells). These

transcripts can be used for diagnosis, prognosis, monitoring and

transcripts can be used for diagnosis, prognosis, monitoring and

transcripts can be used for diagnosis, prognosis, monitoring and

creatment of breast cancer, particularly where metastatic. Diagnosis is

transcripts and used for diagnosis, monitoring and

compounds that modulate expression of the transcripts are potentially

compounds that modulate expression of the transcripts are potentially

consciulatly an antigen-encoding sequence for use in gene or cell-based

contines. Polypeptides encoded by the transcripts are also useful in

contines, for diagnosing breast cancer and for rasing specific

antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic

agants. Host cells that produce the polypeptides can be used to expand

and isolate populations of educated, antigen-specific immune effecter

colls, e.g. oytotoxic T lymphocytes, and these used for adoptive .; 0 Gaps ; 0 Score 7.4; DB 1; Length 10; Pred. No..1.6e+02; 0; Mismatches 1; Indels Sequence 10 BP; 0 A; 3 C; 4 G; 3 T; 0 U; 0 Other; Claim 1; Page 164; 219pp; English. Query Match

AA283942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour calls). These tissue (i.e. are downregulated in metastatic breast tumour calls). These transcripts can be used for disquosis, prognosis, monitoring and transcripts can be used for disquosis, prognosis, monitoring and transcripts can be used for disquosis, prognosis, monitoring and transcripts are medulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected call types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based to vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-epecific immune effecter cells the produce the polypeptides can be used to expand and isolate populations of educated, antigen-epecific immune effecter cells.

that are preferentially transcribed in the metastatic oreast tumour that are preferentially transcribed in the metastatic oreast tumour (1.8. are upregulated in metastatic breast tumour cells). AA283942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These or issue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosic, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also riboxymes or antisense sequences), particularly an antigen-encoding sequence for use in gine or cell-based contines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic I lymphocytes, and these used for adoptive
Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

that are preferentially transcribed in the metastatic breast tumour that are preferentially transcribed in the metastatic breast tumour (i.e. are upregulated in metastatic breast tumour cells). AA286577 represent tags corresponding to distinct transcribts that are to AA286677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metasitatic breast tumour cells). These crissue (i.e. are downregulated in metastatic breast tumour cells). These transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcribts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences).

Compounds that an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raishing specific antibodies (b). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells that produce the polypeptides can a used to expand and isolate populations of educated, antigen-specific immune effecter.
                                                                                                                                                                                                                                                                                                          Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnomis, prevention and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
that are preferentially transcribed in the metastatic breast tumour
tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942

to AAZ86677 represent tags corresponding to distinct transcripts that are
preferentially transcribed in the primary or non-metastatic breast tumour
tissue (i.e. are downregulated in metastatic breast tumour cells). These
transcripts can be used for diagnosis, prognosis, monitoring and
transcripts can be used for diagnosis, prognosis, monitoring and
transcripts can be used for diagnosis, prognosis, while promoters from
transcripts are modulate expression of the transcripts are potentially
useful for treatment of (metastatic) breast cancer, while promoters from
the transcripts are used to direct expression, in selected cell types, of
the transcripts are used to direct expression, in selected cell types, of
particularly an antigen-encoding sequence for use in gene or cell-based
vaccines, Polypeptides encoded by the transcripts are also useful in
vaccines, for diagnosing breast cancer and for raising specific
antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic
agents. Host cells that produce the polypeptides or as therapeutic
cand isolate populations of educated, antigen-specific immune effecter
calls, e.g. cytotoxic T lymphocytes, and these used for adoptive
immunotherapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                            Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used to hybridisation/amplification reactions. Owngounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for use in gene or cell-based antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-epecific immune effecter cells, e.g. cytotoxic I lymphocytes, and these used for adoptive
                                                                                                                                                                                                                                                                                              Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

that are preferentially transcribed in the metastatic breast tumour that are preferentially transcribed in the metastatic breast tumour cells). AAZ88677 represent tags corresponding to distinct ranscribts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These tissue (i.e. are downerspilated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used to the transcripts are potentially useful for treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are seed to direct expression, in selected cell types, of e.g. therapeutic genes (also riboxymes or antisense siquences), particularly an antigen-encoding sequence for use in gene or cell-based continues. For diagnosing breast cancer and for raisin, specific antibodies (Ab). Ab are used to detect the polypeptids or as therapeutic agents. Host cells that produce the polypeptids can be useful in and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

AA283942 to 5A286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour calls). AA283942 to 5A286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour calls). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts are modulate expression of the transcripts are potentially useful for trearment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy

that are preferentially transcribed in the metastatic breast tumour cells.

that are preferentially transcribed in the metastatic breast tumour cells. AAZ89342

to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in metastatic breast tumour cells). AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts are used to direct expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell-types, of e.g. therapeutic genes (also ribozymes or antisense sequences) particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy
Isolated polymucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

```
that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ8657 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). Preferentially transcribed in the primary or non-metastatic breast tumour cells transcripts care downregulated in metastatic breast tumour cells). These transcripts care be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cents.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ80977 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-meta-static breast tumour cells). Preferentially transcribed in the primary or non-meta-static breast tumour cells or issue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also riboxymes or antisense siquences), particularly an antigen-encoding sequence for use in jene or cell-based contines, for diagnosing breast cancer and for raisin, specific antipodies (Ab). Ab are used to detect the polypeptids or as therapeutic agents. Host cells that produce the polypeptids can as therapeutic and isolate populations of educated, and these used for adoptive calls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ8667 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). AAZ83942 transcribts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for the transcripts are potentially by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially cuseful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antisen-encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines, for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-encoditic immune effecter cannot be used to expand and isolate populations of educated, antigen-epocific immune effecter cannot be used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                         AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts
Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer.
                                                                                                                                                                                                                                                                                     Claim 1; Page 126; 219pp; English.

```
The present invention describes 100 human genes, which are expressed most frequently in human monocytes. The CDNA of each gene has a sequence fully defined in the specification, and lacking the CATG sequence foulty adjacent to polyA region. Also described are: (1) an antibody cajacent to polyA region. Also described are: (1) an antibody of specifically for the protein encoded by any of the genes; (2) oligonucleotides obtained from the cDNA sequences; (3) 380 human genes which are expressed most frequently in human macrophages, differentiated from human monocytes by granulocyte-macrophage colony-stimulating factor, the CDNA of each gene has a fully defined sequence, given in the specification, lacking the base sequence. CATG located most closely to the specification, lacking the base sequence CATG located most closely to the poly A region; (4) an antibody specifically for the protein encoded by any of the genes of (3); and (5) oligonucleotides obtained from the cDNA sequences of (3); and disease onset mechanism e.g. oncogeness, genetic genesic diseases, drug development and diagnosis. AAAS6107 to AAAS6586 represent specifically claimed oligonucleotide tag sequences for human genes conset macrophages conset macrophages
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Genes most frequently expressed in human monocytes and GM-macrophages and M-macrophages studied and with cDDNAs characterized, for study of gene specificity, disease onset mechanism, drug development and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Parallel selex; diagnosis; pharmaceutical; agricultural; identification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention describes an isolated nucleic add molecule (I) consisting of a cis-acting mRNA transport sequence (RFS) (Ia) of a myelin basic protein (MBP) cDNA or its portion that enhances transport of mRNA within the cytoplasm, or consisting of a cis-acting mRNA localisation enhancer (RLE) (Ib) of MBP cDNA or its portion which anhances localisation of mRNA within the cytoplasm. (I) placed 5' or 3' to a
                                                                                                                                                     Identifying one or more sequences of a target nucleic acid (NA), useful for parallel analyses, comprises contacting the NA wish a set of pools of probes comprising mixture of probes with different insormation regions.
                                                                                                                                                                                                                                                                                                                The present sequence is a probe used to demonstrate the method of the invention, which is concerned with the use of pools of probes to enable sequencing by hybridisation, a process known as SBH. Overlapping probes are used which allows the identification of sequences longer then the probe length, and either the target unucleic acid or the probe is labelled. The method of the invention is useful for assembling sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid molecule having cis-acting mRNA transport sequence or localization enhancer which enhance transport or localization of mRNA within cytoplasm, respectively, is useful for enhancing gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Myelin basic protein; MBP; cis-acting mRNA transport sequence; RTS; cis-acting mRNA localisation enhancer; RLE; gene therapy; localisation; transport; translation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method has been developed for producing a product having the ability to perform a preselected function on a target. The method can be used for identifying products capable of performing a preselected function on a target. The products identified of the product a paramaceutical compositions, diagnostic reagents, agricultural compositions or manufacturing compositions. The mucleic acid that specifically facilitates the desirable product formation can be easily amplified and the product reliability reproduced in subsequent rounds of production. This method allows a multitude of reactions to take place initially which can be sorted out later once it has been determined that products which display predetermined desirable characteristics have been formed. Using the method, products may be selected for, in the absence of detailed structural information. The present sequence represents an account of the present sequence represents an account of the present sequence represents and product and products may be ablested for, in the absence of detailed and account of the present sequence represents and product and products may be ablested for, in the absence of detailed and account of the present sequence represents and product and products may be ablested for, in the absence of detailed and product and products may be ablested for, in the absence of detailed and products may be ablested for in the absence of detailed and product and products may be ablested for in the absence of detailed and product and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New method for identifying products which act on a target, useful for identifying products for use in e.g. pharmaceutical, diagnostic, agricultural and manufacturing compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequencing; sequencing by hybridisation; SBH; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       structural information. The present sequence represents an oligonuclectide which is used in the exemplification of the present

```
heterologous gene that is operably linked to a 5' regulatory region and a 3' termination sequence, in an expression vector is useful for expressing a heterologous gene which involves transforming a host cell with the expression vector. (I) confers properties such as localisation, transport and increased translation efficiency of a heterologous mRNA transcript when transcribed into such mRNA. (I) present in a vector is useful for increasing translation of a heterologous gene, by which increased production of recombinantly produced proteins in vivo on either a small, research scale or on a large commercial scale is increased. The recombinantly produced proteins whose translation is enhanced by (I) may be a biologically active protein, structural or therapeutic protein. (I) is useful in gene therapy. The present sequence represents an MBP consensus RTS decanucleotide sequence which is given in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to haplotyping the FK506-binding protein 8 (38kD) (FKBP8) gene in an individual. The method involves determining the identity of the nucleotide pair at one or more polymorphic sites selected from P1 to P26 (described in the specification). The invention is useful to improve the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with FKBP8 activity, for example immunosuppression and cancer. Sequences PA167352-403 represent oligonocleotide primers for detecting FKBP8 gene polymorphisms by primer extension techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New haplotypes of the FK506-binding protein 8 gene, useful for genotyping that gene in individual and to design new therapy for associated disease such as immunosuppression and cancer.
                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FKS06-binding protein 8; FKBP8; haplotyping; polymorphism; cancer; immunosuppression; human; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to haplotyping the FKSOG-binding protein 8 (38kD) (FKBPB) gene in an individual. The method involves determining the identity of the nucleotide pair at one or more polymorphic sites selected from PI to P26 (described in the specification). The invention is useful to improve the efficiency and reliability of several steps in the RABPS activity, for example immunosuppression and cancer. Sequences AAI67352-403 represent oligonucleotide primers for detacting FKBPB gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New haplotypes of the FK506-binding protein 8 gene, useful for genotyping that gene in individual and to design new therapy for associated disease such as immunosuppression and cancer.

The invention relates to haplotyping the FK506-binding protein 8 (38kD) (FKBP8) gene in an individual. The method involves determining the identity of the nucleotide pair at one or more polymorphic sites selected from P1 to P26 (described in the specification). The invention is useful to improve the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with FKBP8 activity, for example immunosupression and cancer. Sequences PA167352-403 represent oligonicleotide primers for detecting FKBP8 gene polymorphisms by primer extension techniques
                                                                                                                                                                                                                                                                                                                                                   New haplotypes of the FK506-binding protein 8 gene, useful for genotyping that gene in individual and to design new therapy for associated disease such as immunosuppression and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         transcriptome, gene expression pattern; cancer; drug screening; diagnosis; cell specific gene expression; ss.

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-
AH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, center specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce
                                                                                                     New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          isolated polynucleotides, useful for identifying specific cell type,
n as cancer cell, comprises transcriptomes express∈d in particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, transcriptome, gene expression pattern, cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
 cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular

The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transcriptome, gene expression pattern, cancer, drug screening;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAM63161.

AMM64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, transcriptome, gene expression pattern, cancer, drug screening;

ô The present invention relates to a lentivirus transfer vector with modified 5. long terminal repeat (LTR) and 3. LTR. The vector is useful for producing a recombinant lentivirus in mammalian cells. The virus is useful for in vivo and ex vivo transfer and expression of nucleic acid sequences. The recombinant lentivirus is useful for treating HIV-infected cells, cystic fibrosis, Huntington's disease, Parkinson's disease and Alzhelmer's disease. The vector is also useful for synthesizing lentiviral vector transcripts which can be packaged and lentiviral proteins for rapid production of high titer recombinant lentivirus in mammalian cells Gaps ö Score 7.4; DB 1; Length 10; Pred. ```
The present invention describes polymucleotides comprising single nucleotide polymorphisms (SNPs) in the human dopamine receptor D2 (DRD2). The polymucleotides may be used in assays to detect and characterise polymorphisms in DRD2 that affect its expression and activity and are involved in disorders such as schizophrenia, Parkinson's and myoclonus pystonia disorders such as schizophrenia, Parkinson's and myoclonus biological function of DRD2 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression of active and functional polypeptides. Therafore it is advantageous to detect polymorphisms in the DRD2 gene affect the expression of active and functional polypeptides. Therafore it is advantageous to detect polymorphisms in the DRD2 gene affect the polymorphisms are combined in different copies of the gene. AAF70261 to AAF70309 to AAF70304 represent human DRD2 allele specific oligonucleotide probes, and papingers which are used in the detection of DRD2 polymorphisms. AAF70405 to AAF70453 to AAF70538 represent oligonucleotide primers for the detection of human invention. AAF70453 to AAF70538 represent properties of the present invention. AAF70453 to AAF70538 represent present invention the human DRD2 gene which are used in examples from the present invention
                                                                                                                                                                                                                                                                                                         Polynucleotides comprising single nucleotide polymorphisms in the human dopamine receptor D2, useful for detecting mutations associated with, e.g. schizophrenia, Parkinson's and myoclonus dystonia.
                                                                                                                                                                                                               Stephens JC;

Ceruloplasmin (ferroxidase) ovarian tumour marker SAGE tag, #109

(first entry)

08-FEB-2002

Ovarian tumour marker gene; human; overexpression; upregulation; epithelial tumour; cancer; diagnosis; prognosis; disease monitoring; dentification; serous cystadenoma; borderline serous tumour; serous cystadenoma; mucinous cystadenocarcinoma; mucinous cystadenocarcinoma; mucinous cystadenocarcinoma; undifferentiated carcinoma; olear cell adenocarcinoma; cystadenofibroma; adenofibroma; gene expression; immune response pathway; cell proliferation regulation; protein folding; membrane localised; secreted; therapeutic target; cytostatic; gene therapy; vaccine; SAGE tag; ss

sapiens Homo

```
The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA81081-ABA81122, ABA81120, ABA81180, ABA81181 and ABA81181 The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for monitoring a patient in remission from ovarian cancer and in tests for monitoring disease status in a patient being treated for ovarian cancer. The methods can additionally be used to identify a particular tumour and being an ovarian tumour (i.e., an epithelial ovarian tumour selected from serous cystadenoma, borderline serous tumour, serous cystadenocarcinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mucinous cystadenoma, borderline mucinous tumour, mucinous cystadenoma, orgenatedenocarchinoma, endifferentiated carcinoma, orgenatedenocarchinoma, endifferentiated carcinoma, clear cell adenocarcinoma, cystadenofibroma, adenofibroma and Brenner tumour. The ovarian tumour marker genes of the invention were identified using SAGE (serial naalysis of gene expression) and were found to be overexpressed in a broad variety of ovarian epithelial tumour cells relative to normal ovarian epithelial cells. The marker genes are
                                                                                                                                                                                                                                                                  Detecting and identifying ovarian tumor, identifying increased risk for developing ovarian cancer, and determining effectiveness of ovarian cancer treatment, by measuring expression level of ovarian tumor marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        implicated in immune response pathways, in the regulation of cell
proliferation and in protein folding, and many of these are membrane-
localised or secreted. In addition to their use as diagnostic and

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 284; 419pp; English

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate or antifungal drugs comprising: (a) contacting a test substance which modifies the expression of antifungal drug comprising candidate antifungal drug; (3) a method (M3) for cell; and (A) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression continuous nucleotidaes of a NORF gene whose expression in a congrising contacting a phase of an open expression in a congrising contacting a yeast cell of at least 1 NORF gene whose continuous nucleotidaes of a NORF gene whose expression is affected by the class of the cell cycle of a class of drugs; the old of a least 1 NORF genes may be used to identify candidate drug as a member of expression is affected by the class of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and to identification of antifungal drugs, ARF33268 to AAF33267 represent linkers and PCR primer; used in the exemplification of the present invention.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 314; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonamonated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes whose expression varies by at cast 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of antifungal drugs (m) send of the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for cell; and (b) monitoring expression of a method (M3) for comprising contacting human penes which are involved in cell cycle progression of a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a cut (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell of the cell cycle. The methods may be used to identify and a markers of phases of the cell cycle. The methods may be used to identify and a markers of the semplification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention.

Example; Page 147; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression nor not between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifurgal drugs, and (D) monitoring expression of a NORF gene whose expression of cell; and (D) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifurgal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a class of drugs having a characteristic effect on gene expression in a contiguous nucleotides of a nord and a probe which comprises as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a conticuing expression in the yeast cell with a method (M4) for identification of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and feet may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and feet identification of antifungal drugs; the differentially cycle cycle and feet identification of antimage and feet identification of antimage and feet phases of the cell cycle and feet identification of a the present invention. AAF33267 represent linkers and PCP Invention of the present invention.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 248; 419pp; English

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonanotated ORP) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate of antifungal drugs comprising; (a) contacting a test substance which a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at in M1; and (4) a method (M4) for identifying a candidate drug as a member of a contiguous nucleotides of a NORF gene whose expression in a method (M4) for identifying a yeast cell with a candidate drug and contacting expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle, the differentially expression is affect by asset cell of at least 1 NORF genes may be used to identify candidate drugs which affect the cell cycle and tot identification of antifungal drugs. The NORF genes may be used as markers of phases of the cell cycle the cell cycle and tot identification of antifungal drugs. Affect the cell cycle are mathods may be used to identify candidate drugs which affect the cell cycle are method, in the exemplification of the present invention.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonamotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression or varies as in M1, where a test substance which modifies the expression of comprising contacting human DNA with a probe which comprises at least 10 comprising contacting a wast call cover a candidate antifungal drug; (3) a method (M4) for identifying a candidate drug as a member of contacting expression in a yeast cell of at least 1 NORF gene whose expression in a yeast cell comprising contacting a yeast cell with a candidate drug and contacting expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle. The open and be used to study, monitor and affect phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle of cycle and for identification of antifungs drugs drugs which affect the cycle of cycle cycle and for identify candidate drugs where 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Yeast, Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotaged ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonanoctated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drug comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contacting human DNA with a probe which comprises at least 10 comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression in a yeast cell comprising contacting a yeast cell with a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell of at least 1 NORF gene whose expression in a yeast cell of a least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to strudy, monitor and affect phases of the cell cycle, the differentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonamotated.ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drug comprising; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression carries as in M1, where a test substance which modifies the expression comprising contexting human panes which a probe which comprises at least 10 comprising contexting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and
                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 214; 419pp; English

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonanotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human pnA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1;

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M.) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and 62/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Yeast NORF gene SAGE tag oligonucleotide SEQ ID NO:11331.

Kinzler K;

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 354; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at cast 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast RESULT 345

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monicoring and affecting phases of the cell cycle.

Example; Page 372; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotates! ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (MI) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at

```
chast 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression to yeast gene is a candidate antifungal drug; (3) a method (M3) for cheristying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a class of drugs having a characteristic effect on gene expression in a class of drugs having a characteristic effect on gene expression in a class of drugs and place of the class of drugs and and affect phases cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle and for identification of antifungal drugs. Aspi3268 to AAF44064 cepresent SAGE tags used in the exemplification of the present invention.

AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering administering a NORF gene whose expression varies by at cate through drugs comprising a NORF gene whose expression varies by at anithurgal drugs comprising; (a) contacting a test substance with a yeast call; and (b) monitoring expression of a nithurgal drugs comprising; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a northing a candidate anithurgal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle, the differentially expression is affected by the class of the cell cycle, the differentially cortacting any be used as markers of phases of the cell cycle. The methods may be used to identify admiddate drugs which affect the cell cycle and for identification of antifungal drugs. Apr33268 to AAF33262 represent invention. AAF33262 to AAF33267 represent invention of the present invention. AAF33262 to AAF33267 represent invention of the present invention. Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 181; 419pp; English

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonamotetria ORF) genes comprising a shall analysis of gene expression; tag. Also described are: (1) a method (M1) of using NORF gene whose expression varies by at cycle comprising administering a NORF gene whose expression varies by at clast 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drug comprising expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying a candidate drug as member of a comprising contacting human DNA with a probe which comprises at least 10 comprising contacting a yeast cell inth a candidate drug and conticting expression in a class of drugs having a characteristic effect on gene expression in a characteristic effect on gene expression in a cypression is affected by the class of the cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle. The methods may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF33267 represent in the exemplification of the present invention.

AAF33262 to AAF33267 represent linkers and PCR pinners used in the SAGE method, in the exemplification of the present invention.

```
The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human small inducible cytokine A3 (SCYA3) gene located on chromosome 17g1-421, and methods for haplotyping and/or genotyping the SCYA3 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or primer-extension oligonucleotides for detecting the SCYA3 gene polymorphisms. The polymucleotides and screened compounds are useful for (developing) treatment of diseases associated with SCYA3 activity, such as inflammanory disorders e.g. atopic dermatitis, rheumatoid arthritis, multiple sclerosis, pulmonary fibrosis and sarcoidosis. AASI8712-AASI8712 represent primer-extension oligonucleotides for detecting human SYCA3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Primer-extension oligonucleotide #11 to detect human SCYA3 polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; single nucleotide polymorphism; SNP; SCYA3; chromosome 17q11-q21;

.. 0 The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human small inducible cytokine A3 (SCYA3) gene located on chromosome 17q11-q21, and methods for haplotyping and/or genctyping the SCYA3 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or primer-extension oligonucleotides for detecting the SCYA3 gene polymorphisms. The polymucleotides and screened compounds are useful for (developing) treatment of diseases associated with SCYA3 activity, such as multiple associated with SCYA3 activity, such as multiple sclerosis, pulmonary fibrosis and sarcoidosis. AASI8713-AASI8742 represent primer-extension oligonucleotides for detecting human SYCA3 gene polymorphisms The present invention provides the protein, gene and CDNA sequences of the human potassium voltage-gated channel, Shab-related subfamily, member 1 (KCNB1) isogene and polymorphisms identified within these esquences. The sequences can be used to screen drugs, which involves contacting the polypeptide with a candidate agent, and to assay for binding activity as a target for drugs to treat arrhythmia and seizures. Ine present sequence is a primer extension oligonucleotide described in the invention Isolated polymorphic variants of potassium voltage-gated channel, Shabrelated subfamily, member 1 (KCNB1) gene useful for expressing KCNB1 protein isoform to screen drugs to treat KCNB1 activity-related disease. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or primer-extension oligonucleotides for detecting the IMPDH2 gene polymorphisms. The polymucleotides and screened compounds are useful for (developing) treatment of diseases associated with IMPDH2 activity, such as cancer. AASI8280-AASI830s, represent primer-extension oligonucleotides
                                                                                                                                                                                                                      Primer-extension oligonucleotide #6 to detect IMPDH2 gene polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide having polymorphic variant of IMP2 dehydrogenase gene, useful for studying expression of the gene in vivo, and for testing efficacy of therapeutic agents for cancer in biological

The invention relates to single nucleotide polymorphisms in the gene encoding the human coagulation factor XII (F12) polypeptide. A method for encoding the human coagulation factor XII (F12) polypeptide. A method for haplotyping the F12 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the F12 haplotypes given to pair. This method is useful in genotyping, whereby all possible haplotype pair can be assigned to specific genotypes. An association between a pair can a haplotype or haplotype pair of the F12 gene can be identified by comparing the frequency of the haplotype or haplotype pair in of the haplotype pair in a reference population, where a higher haplotype or haplotype pair. F12 and its corresponding DNA are used for studying the expression and function of F12, for use in screening for candidate drugs to treat disorders related to F12 eacivity such as coronary artery disease, liver disease, spontaneous abortion, Alzheimer's disease and other diseases associated with defects in blood coagulation. The sequences are also useful for studying it effects in blood cagulation. The sequences are also useful for studying it effects in blood cagulation. The sequences are also useful for studying it effects in blood cagulation. The sequences are also useful for studying the effect of variation on the biological activity of F12 seeme bolymorphisms by primers and primer tails used to detect F12 gene polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated human coagulation factor XII polynucleotide, F12 useful for treatment of e.g. coronary artery disease, comprises a sequence which is a polymorphic variant of a reference sequence for F12 gene or its
